

Thermalabs Premium Exfoliating Mitt to Ship with a New, Patented Exfoliating Device

Thermalabs exfoliating mitt will now ship with a new, finger-bound exfoliator.

February 17, 2017 (FPRC) -- Thermalabs has created a new, innovative exfoliating product. Dubbed the finger-bound exfoliating device, this is a small accessory that can be inserted in the finger to help exfoliate small detail areas such as around the eyes and the nose. The company has already registered a patent for this device. According to Alex Howard, the company's marketing coordinator; Thermalabs will be shipping the new exfoliator together with its popular exfoliating mitt.

Thermalabs is a major player in the global cosmetics space. The company has so far furnished the market with over three dozen products. The majority of these are self-tanners and tanning accessories. Some of the most popular tanning-focused releases by Thermalabs include the Original Self Tanner, the Ultimitt tan applicator mitt, the Tan Enhancer Lotion, the Exfoliating mitt, and the Glow2Go tanning wipes. In addition to the tanning space, Thermalabs has also expanded to cover other market areas. The firm's Supremasea sub-brand oversees research and production of skincare products using Dead Sea salts as the main ingredient. Thermalabs Tent World sub-brand manufactures quality outdoor tents.

Thermalabs exfoliating mitt was launched early last year. This is a wearable scrubbing glove that helps people exfoliate for a smooth, flawless skin. According to Thermalabs, the glove is created from top-quality natural materials that make it an ideal accessory to remove dead skin cells, stimulate proper blood circulation in the skin, unclog pores, and reduce body hair growth. Exfoliating also helps with cell rejuvenation and thus leads to a smoother and healthier-looking skin. Mr. Howard has also said that the company's exfoliating has been tested to show that it can help with age spots, wrinkle lines, acne, and many other common skin conditions.

Most people do not have a problem exfoliating with Thermalabs premium glove. However, a section of the company's consumers had reported difficulties being able to do so around the eyes, the nose, the ears, and on other small detail facial areas. Thermalabs apparently took initiative and decided to commence research work on how they could solve this problem. Three months down, the top researcher at the company's primary factory in Israel came up with a solution; a finger-bound exfoliator. The company created this product and patented it so that competitors wouldn't just copy it.

"Thermalabs will from today henceforth ship its premium exfoliating mitt together with our new finger-bound exfoliating device. There will be no increase in the cost of our premium glove. This new accessory was created to solve a problem that some of our users complained about. We wanted to make it super easy for users to exfoliate in small detail facial areas such as around the eyes. Our finger-bound device has a registered patent and will help you get polished results every time when you use our premium glove. Stay tuned for more from your number one cosmetics brand," said Alex Howard.
